Solution Requirements

Date	29 September 2026
Team ID	SWTID-2026-6221
Project Name	Importing & Securing Employee Training Data in ServiceNow
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

The solution requirements define what the Employee Training solution must do and the quality criteria used to verify accurate data import, reliable employee relationships, and secure access to training records.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority
1	Authentication	Users must sign in to the ServiceNow instance with an identifiable user account before accessing the Employee Training table.	High
2	Data Import	Training Name, Completion Date, Status and Employee data must be loaded from Excel using System Import Sets and Load Data.	High
3	Data Transformation	A Transform Map must map the imported source fields to the Employee Training target fields.	High
4	Employee Relationship	The Employee field must reference the ServiceNow user table so each training record is linked to an employee.	High
5	Dot-Walking	The solution should allow related employee information such as Department to be accessed through dot-walking.	Medium
6	Authorization	An HR Manager role and Read/Write ACLs must control access to Employee Training records.	High
7	Reporting	Administrators should be able to inspect Employee Training lists and verify imported and accessible records.	Medium
8	Testing	Impersonation must be used to verify behavior for authorized and unauthorized users.	High

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	Import and ACL evaluation should occur as part of normal ServiceNow processing without unnecessary custom processing.	Import/access operation completes during normal ServiceNow processing.
2	Scalability	The solution should use native ServiceNow Import Sets, reference fields, roles and ACL mechanisms.	Security and data relationships remain server-side and consistently enforced.
3	Security & Data Privacy	Unauthorized users must not gain Read or Write access through the protected ACLs.	Users without the required role are denied; authorized HR users receive permitted access.
4	Reliability & Availability	Import mappings, reference relationships and access rules should remain consistently available across supported ServiceNow interfaces.	Same configuration works consistently for list/form/record operations.
5	Usability & Accessibility	Authorized users should see only the records and actions allowed by their roles, while administrators can manage the configuration.	New/Edit availability matches evaluated ACL permissions.
6	Maintainability	Import fields, reference relationships, roles and operations should be clearly separated and documented.	Each configuration item has a clear purpose and can be changed independently.
