	Importing & Securing Employee Training Data in ServiceNow
	3 Marks

Project Executable Files

For this ServiceNow project, the deliverable is primarily a configured ServiceNow table, import configuration, reference relationship and ACL configuration rather than a standalone APK or desktop executable. The checklist below records which submission items apply to the project.

Step 1: Submission Checklist

Item to Submit	Submitted	Project-specific Note
source code (all files and folders)	NA	ServiceNow configuration is the main deliverable; no standalone source-code folder is required.
/ Setup Guide	Yes	Run/setup instructions are included in the project documentation.
nts.txt / package.json / dependency file	NA	No local application dependency file is required for this ServiceNow configuration.
schema / seed files	NA	The schema is created directly as the Employee Training ServiceNow custom table; imported records are created in the instance.
nt configuration file	NA	No external application .env file is required for this ServiceNow project.
application URL	NA	No separate hosted web application URL is specified.
cutable binary	NA	Not applicable to a ServiceNow configuration project.
/ Containerization config	NA	Not specified or required.
nd test results	Yes	ACL verification is performed through impersonation, list/form checks and authorized/unauthorized user testing.
o / walkthrough	NA	Not provided in the project content.

Step 2: File / Configuration Structure

The project is configured inside a ServiceNow instance. The logical structure for the deliverable is:

```
ServiceNow Instance ■■■ User Administration ■ ■■■ Users ■ ■■■ HR Manager Role ■ ■■■ System Definition ■ ■■■ Tables ■ ■ ■■■ Employee Training (u_employee_training) ■ ■ ■■■ Training Name ■ ■ ■■■ Completion Date ■ ■ ■■■ Status ■ ■ ■■■ Employee → sys_user ■ ■■■ Form/List Layout ■ ■■■ Employee → Department (dot-walking) ■ ■■■ System Import Sets ■ ■■■ Load Data ■ ■■■ Transform Maps ■ ■■■ Employee Training field mappings ■ ■■■ System Security ■■■ Access Control (ACL) ■■■ READ → HR Manager ■■■ WRITE → HR Manager
```

Step 3: Deployment / Access Details

Field	Details
RL	ServiceNow instance URL — not supplied in the project content.
mo)	Administrator and test-user credentials are managed inside the ServiceNow instance and are not included in this document.
vider	ServiceNow instance / training environment.
	Not provided.
	Not provided.

Step 4: Run Instructions

Pre-requisites

- ServiceNow instance with admin access.
- Ability to elevate to security_admin.
- Permission to create tables, fields, users, roles and ACLs.
- Excel source file containing the four required fields.

Execution Steps

1. Log in to the ServiceNow instance with administrator access.
2. Create the Employee Training table under System Definition → Tables.
3. Add Training Name, Completion Date, Status and Employee fields.
4. Configure Status choices and Employee as a reference to sys_user.
5. Prepare the Excel file and use System Import Sets → Load Data.
6. Create the Employee Training import set and a Transform Map with field mappings.
7. Run the Transform Map and verify imported records.
8. Configure Employee → Department using dot-walking in the form/list layout.
9. Create the HR Manager role and assign it to the test user.
10. Elevate to security_admin and create Read and Write ACLs for Employee Training.
11. Impersonate the authorized user and verify that records can be viewed/edited as configured.
12. Impersonate another user and verify that unauthorized access is restricted.
13. Impersonate an administrator and verify full administrative access.

Step 5: Known Issues / Limitations

Known Issue / Limitation	Workaround / Status
one executable file exists for this ServiceNow configuration project.	NA — configuration is executed within the ServiceNow instance.
w instance URL and credentials are not included.	Add evaluator access details before final submission if required.
and demo-video links are not provided.	Attach the relevant links if required by the evaluator.
rformance/load-test measurements are not part of the documented import/ACL workflow.	Functional ACL verification is performed through impersonation; formal performance testing require tooling/data.
