	Importing & Securing Employee Training Data in ServiceNow
	Documentation

Project Description

This project demonstrates how ServiceNow can be used to import employee training information from an Excel spreadsheet, link each training record to an employee, access related employee information such as Department through dot-walking, and protect the Employee Training table with role-based Access Control Lists (ACLs).

The solution creates an Employee Training table with Training Name, Completion Date, Status and Employee fields. Import Sets and Transform Maps are used to load the spreadsheet data. An HR Manager role is used with Read and Write ACLs, and user impersonation is used to verify authorized and unauthorized access.

Project Scenarios

rio	Description
	An authorized HR Manager opens Employee Training records and can view the permitted records.
	A user without the required role attempts to access Employee Training and access is restricted by the ACL configuration.
	Imported Excel records are transformed into the Employee Training table with Training Name, Completion Date, Status and Employee values.
	The Employee reference is used to access related Department information through dot-walking.
	An authorized HR Manager edits a permitted Employee Training record through the Write ACL.
	An administrator retains full administrative access to configure and verify the solution.

Technical Architecture

	Component	Responsibility
	ServiceNow List & Form	Users access Employee Training records through ServiceNow lists and forms.
ty	User + HR Manager Role	The user account and assigned role determine whether ACL checks can succeed.
	Import Sets + Transform Map	Excel source data is loaded and mapped to the Employee Training target fields.
	ACL Engine	Read and Write permissions are evaluated using the configured role-based ACLs.
	Employee Training Table	Stores Training Name, Completion Date, Status and the Employee reference.
	Employee Reference + Dot-Walking	Connects the training record to the employee and exposes Department information.
	Impersonation / ACL Verification	Administrator impersonates users and verifies list/form and access behavior.

Architecture Flow

Excel File → System Import Sets → Transform Map → Employee Training Table → Employee Reference → Department Dot-Walking → ACL Evaluation → Allow / Deny Access

Pre-requisites

- ServiceNow instance with administrator access.
- Permission to create custom tables, fields, users, roles and ACLs.
- Ability to elevate to security_admin for ACL configuration.
- Excel spreadsheet containing Training Name, Completion Date, Status and Employee data.
- Test users for authorized and unauthorized access verification.

Project Workflow

	Focus	Activities
	Employee Training Data Model	Create Employee Training table and add Training Name, Completion Date, Status and Employee fields.
	Data Import	Prepare Excel file, use Load Data and create the Employee Training import set.
	Field Mapping	Create a Transform Map and map source fields to the Employee Training fields.
	Employee Relationship	Use the Employee reference field and configure Department through dot-walking.
	Roles & ACLs	Create HR Manager role and configure Read and Write ACLs for Employee Training.
	Security Verification	Impersonate authorized and unauthorized users and verify access and editing behavior.
